

4G Clinical DevOps Code Assessment

Take a look at the standard phone keypad below. You see that each number between 2 and 9 has 3 or 4 letters associated with it, but each letter is associated with only 1 number (ex: a = 2, j = 5).

Given a phone number of length **n** and a list of words, return a list of only the words where each letter of that word corresponds to a number in the phone number.

Sample input:

Phone# = "3662277"

Words = ["foo", "bar", "baz"]

Sample output:

["foo", "bar"]
